

#### ABSTRACT OF THE DISCLOSURE

The invention intends to provide an audio output control circuit capable of reproducing the audio signals inputted to the external input terminals in the multi-channel audio reproduction system with a simplified circuit configuration. The control circuit furnishes the external input terminals with a detection circuit composed of a switch for electrically connecting both of the external input terminals, and a switch circuit. The switch is in a connection state in the normal condition, but when a plug is inserted into the one of the terminals, the switch is made disconnected. When the plug is inserted only into the other one of the terminals, and the monaural signal is inputted, the same monaural signal is outputted from the two terminals. The switch circuit being put in ON and OFF by a current from the other one of the terminals detects the insertion state of a plug.
